

**A Type Catalog of Fossil Invertebrates
(Arthropoda: Chelicerata) in the Yale
Peabody Museum**

Russell D. White

(Received 8 May 1996)

Abstract

Type material for 60 nominal species of fossil chelicerates are in the Invertebrate Paleontology Collections of Yale University's Peabody Museum of Natural History. Primary types for 46 nominal species include 41 holotypes, and 5 syntypes (representing 3 nominal species). Secondary types for 15 nominal species include 31 paratypes. Tertiary types of 19 nominal species include 35 hypotypes. Most types are from Mazon Creek (Illinois), Warren (Pennsylvania), Elmo (Kansas) and Buffalo (New York) and have been described by C.E. Beecher, James Hall, E.N. Kjellesvig-Waering and Alexander Petrunkevitch.

Key Words

Type Catalog, Chelicerata, Yale Peabody Museum, Elmo, Mazon Creek, Warren, Buffalo, C.E. Beecher, James Hall, E.N. Kjellesvig-Waering, Alexander Petrunkevitch.

Introduction

This catalog lists all known fossil chelicerate types in the Invertebrate Paleontology Collections housed in Yale University's Peabody Museum of Natural History. This is the third in a series of type catalogs of fossil invertebrates and is a product of an ongoing computerization project to improve the accessibility of the type collections.

During the late 1800s Othniel C. Marsh acquired many fossils from the area of Mazon Creek (Grundy County), Illinois for the Yale Peabody Museum. Several of these specimens were purchased from S.S. Strong, a private collector from Morris, Illinois. Unfortunately, Strong did not provide specific localities for his collections and a survey of the O.C. Marsh correspondence in the Yale archives has not produced a more specific locality than is given in the text for these specimens.

Organization

Specimens are listed under the originally described binomen; genera and species within genera are indexed alphabetically. Each entry includes the catalog number used by the Division of Invertebrate Paleontology prefixed with the abbreviation YPM and the type status of the original designation, followed by all known references to that name. Any subsequent designations are listed under the original designation and are cross-referenced in the body of the text. Locality descriptions follow

© Copyright 1996 by the Peabody Museum of Natural History, Yale University. All rights reserved. No part of this publication, except brief quotations for scholarly purposes, may be reproduced without written permission of the Director, Peabody Museum of Natural History.

each entry or set of entries for each binomen. Errors and inconsistencies are footnoted at the bottom of each binomen.

The type designations used are holotype and syntype for name bearers; paratype for secondary types; hypotype is used for all tertiary types. Name bearers and secondary types are defined as used in the *International Code of Zoological Nomenclature* (1985). Tertiary types or hypotypes are treated here as any described, figured or measured specimen used in a publication to augment the knowledge of a previously defined species, or any referred specimen that can not be placed unequivocally in a known species (e.g. *Anthracoscorpio* (?) sp.).

Locality descriptions follow each entry or set of entries with identical locality data. The locality information includes the stratigraphy, geography, collector and date. Stratigraphy has been standardized using *Stratigraphic Nomenclature Databases for the United States, its Possessions and Territories* (MacLachlan et al., 1992).
